1 Introduction

These hands-on lab exercises are designed to guide you through the essential aspects of process automation using **BAMOE Developer Tools for VS Code**. Whether you're a developer or an architect, these labs will equip you with the skills you need to use VS Code to effectively build workflow and decision automation projects on modern, cloud-native business automation solutions.

Includes six exercises. We recommend performing them sequentially.

Duration: Approximately 3 hours.

Audience: Anyone who wants to learn how to use IBM Business Automation Manager Open Editions.

1.1 IBM Business Automation Manager Open Editions

IBM Business Automation Manager Open Editions (IBM BAMOE) is a powerful open-source solution that serves as a foundation platform for tailoring long-lasting business automation solutions for the hybrid cloud.

With a developer-centric approach, this comprehensive and flexible platform makes it easy for teams to collaborate through Open Standards and efficient development tools suited for different personas. Each automation solution can be shaped to perfectly address each scenario: business applications are flexible and can effortlessly integrate with external systems of your existing architecture.

Designed for the hybrid cloud, IBM Business Automation Manager Open Editions, accelerates the application modernization and cloud adoption journeys, as the lightweight design tools, business applications and other product components can be containerized and deployed with popular technologies such as Kubernetes and OpenShift.

For more information, see IBM documentation and other useful links:

- IBM Business Automation Manager Open Editions Documentation
- Open Editions Community

2 Lab Setup Instructions

2.1 Access the environment

You received this email with instructions on how to access the environment using your IBMid.

If necessary, this is the Windows credential:

```
User: .\techzone
Password: IBMDem0s!
```

2.1.1 Useful links:

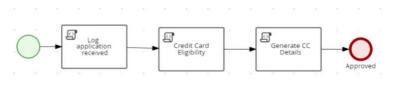

Item	Description		
1	"Environment Info":		
	Access this document available in Box.		
2	"BAMOE Docs":		
	Access the official product documentation.		
	"Learning IBM Business Automation Open Edition":		
3	A great guide for users who are trying IBAMOE for the first time. Recommended getting		
	started guide.		
	"BAMOE Canvas":		
4	You can access BAMOE Canvas through the URL:		
	http://localhost:9090		
5	"BAMOE Management Console":		
	You can access BAMOE Management Console through the URL: http://localhost:7070		
	"Dev UI":		
6	For projects run by VS Code, you can access the Dev UI via the URL:		
	http://localhost:8080/q/dev-ui		

3 The use case

We will work with a fictitious credit card request process, our goal is to demonstrate how to integrate Workflows with Decision services, in addition to exploring multiple scenarios for each data set.

We will use a pre-configured BAMOE project, and throughout the exercises we will modify the Workflow and execute it in practice, essentially setting up the following scenarios:

- **Automatic Approval:** If the credit card applicant's data meets the minimum requirements for approval, the card will be automatically generated.
- **Automatic Rejection:** If the applicant's data does not meet the minimum requirements, it will be automatically rejected.
- **Manual Approval:** There is a scenario where the application analysis must be done manually by a user, who may also be Approved or Rejected.

Now, in this lab, we will work with BAMOE Developer Tools for VS Code, which brings together graphical editors for BPMN, DMN and SCESIM files. Access more in the <u>BAMOE Developer Tools for VS Code</u> documentation.

Note: you know that we will use VS Code for this Lab, if you want to know more about it, access BAMOE Developer Tools for VS Code documentation.

And if you're an **experienced Java developer**, you may have your own preferences when creating new projects. Click <u>here</u> to learn more.

Next, the first exercise begins. Happy studying!

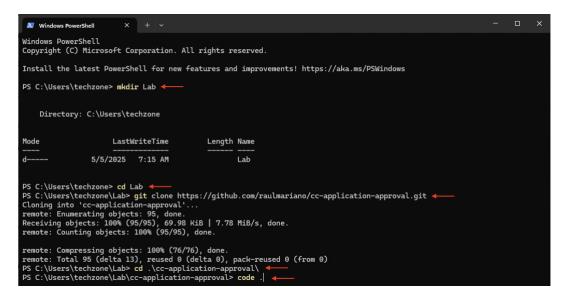

4 Exercise 1: Exploring the Dev-UI console in more detail

As mentioned earlier, we will now work with a pre-built project.

a. From your taskbar, open Git or Terminal.

b. We will download the pre-built project from GitHub:

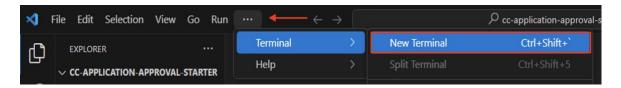

#	Description		
1	Create a new folder: mkdir Lab		
	Enter the new "Lab" folder		
2	cd Lab		
	Enter the command to clone the project:		
3	git clone https://github.com/raulmariano/credit-card-application-approval.git		
	Access the project folder:		
4	cd credit-card-application-approval		
5	Open VS Code using the command:		
	code .		

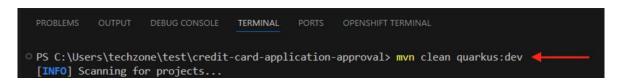

The Kogito project structure focuses on separating the definition of business logic (rules, processes, decisions) from the technical implementation of the Java application, allowing for greater clarity, agility, and ease of maintenance.

c. Explore the project structure and see what features have already been created in this use case.

d. Let's compile the project to explore **DEV-UI**. It is a centralized development interface to understand, debug and interact with the intelligence of your application, in addition to standard information (configuration, health, logs), it offers visualization of BPMN processes, monitoring of instances and tasks.

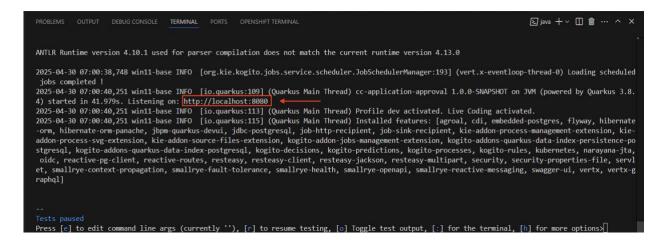

e. Run the command to run the project

Item	Description		
1	mvn clean quarkus:dev		

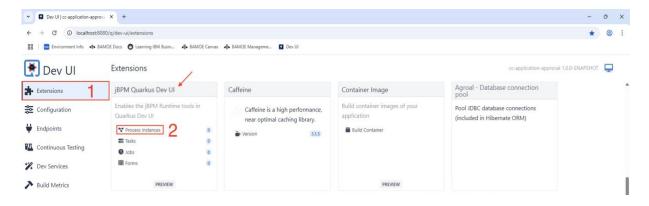

Wait for the process to start. You should see the message Listening on: http://localhost:8080. This may take a few minutes.

f. Open Google Chrome, and go to http://localhost:8080/q/dev-ui.

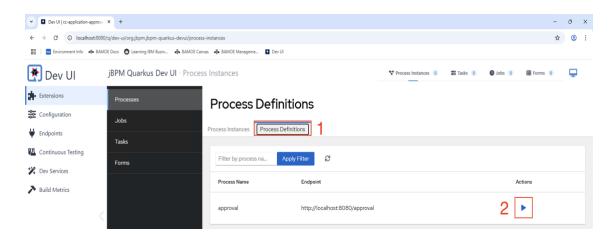

g. Let's understand more about the use case by accessing the process instances.

Item	Description		
1	On the main "Extensions" page, locate the "jBPM Quarkus Dev UI" extension		
2	Click on "Process Instances"		

Note that the layout is like the **BAMOE Management Console**.

h. We continue by creating a new instance to analyse what we have built.

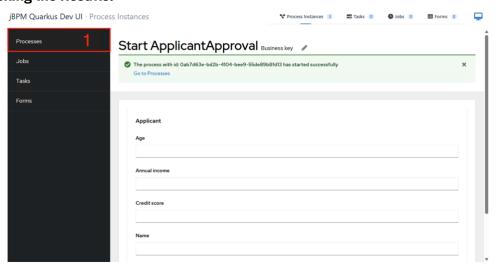

Item	Description	
1	Go to the "Process Definitions" tab	
2	Click to perform the action	

i. We will perform several tests on this form; to facilitate documentation, we will replace the screen print with a table containing the test data. See:

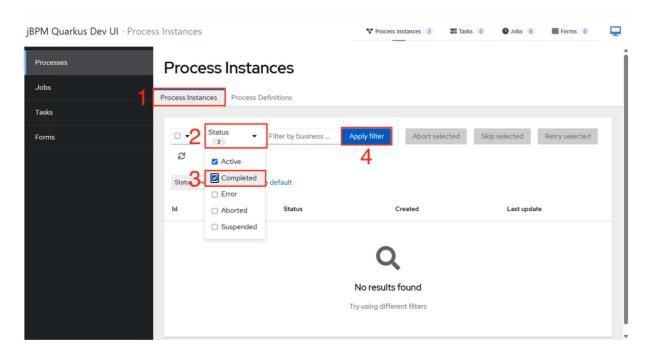

AGE	ANNUAL INCOME	CREDIT SCORE	IS STUDENT	NAME
20	20000	300	YES	[YOUR-NAME]

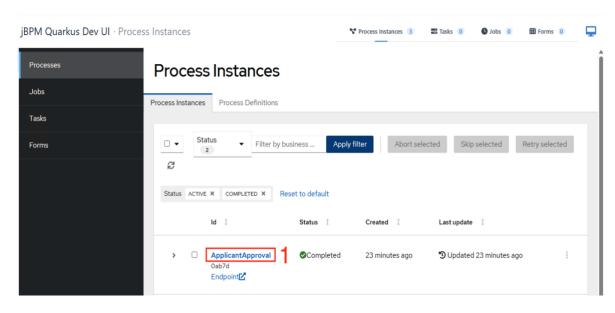

j. Checking the Results:

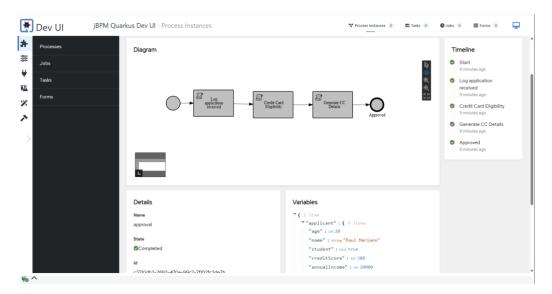

Item	Description	
1	Select "Process Instances"	
2	Select "Status"	
3	Select the status "Completed"	
4	Click on "Apply filter"	

Item Description 1 Click to select the instance you just created.

k. Conclusion

Here you can see what was done in the process, a very straightforward and simple process that performed several "simple" script tasks. In the next exercise, we will start improving this!

Close the browser. Let's work some more in VS Code and then review again when we're done.

Back in the VS Code terminal, stop the execution by pressing the options: [h] then [q].

```
| PROBLEMS OUTPUT DEBUG CONSOLE | TERMINAL | PORTS OPENSHIFT TERMINAL | PORTS OPENSHIPT TERMINAL | POR
```

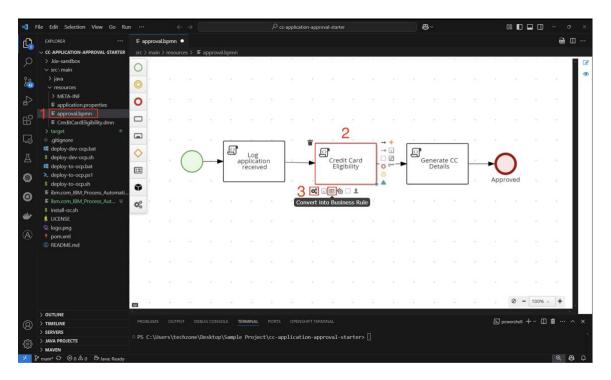

5 Exercise 2: Using DMN in the Process

Scenario:

In this exercise, we will modify the "Credit Card Eligibility" task of the "Approval" process, to incorporate a decision we make (DMN). That is, this task will send the input data to the DMN to execute the business rule, and the DMN result will be used in the next steps of the process.

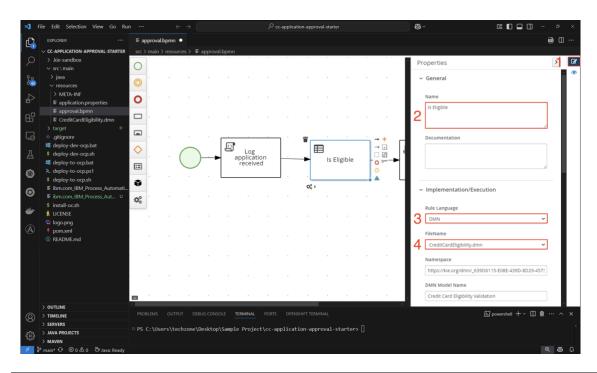

Exercise:

a. Open Credit Card Eligibility task

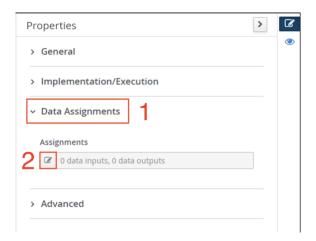

Item	Description		
1	Open the <i>approval.bpmn</i> process, which is located at		
	<pre>src/main/resources/approval.bpmn. Click to open it.</pre>		
2	Select the "Credit Card Eligibility" task		
3	Click on the gear then select the second option to convert into business		
3	rule.		

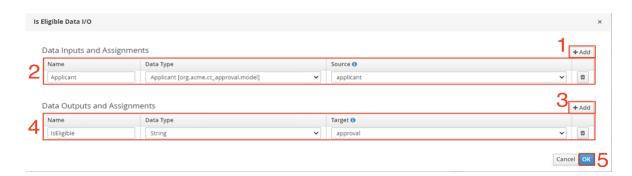

b. Set Is Elgibile Business Rule

Item	Description			
1	Access the element properties menu (similar to BAMOE Canvas)			
2	2 Change the task name to "Is Eligible"			
3	In the "Implementation/Execution" section, select "DMN" in the "Rule			
3	Language" field			
4	And in the "File Name" field select "CreditCardEligibility.dmn"			
5 The remaining fields will be filled in automatically.				

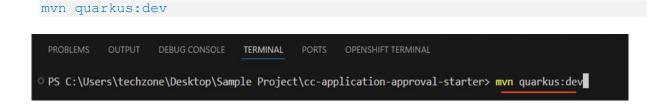

Item	Description	
1	Scroll down in the properties window and expand "Data Assignments"	
2	Click the pencil icon to create them.	

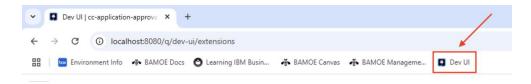

Item	Description		
1	Click "+ Add"		
	Fill in the Data In	Fill in the <i>Data Input</i> fields:	
	FIELD	DATA	
2	Name	Applicant	
2	Data Type	Applicant[org.acme.cc_approval.model]	
	Source	applicant	
3	Click "+ Add" Fill in the Data Ou	t put fields:	
	FIELD	DATA	
4	Name	IsEligible	
4	Data Type	String	
	Source	approval	
5	Click " OK"		

You can and should also open the DMN in parallel, to explore the business rules built, and understand how card eligibility will be carried out.

- c. Before running the project, make sure the project has been saved *(CTRL + S)*, and click the SVG button (in the top right corner), to update the process image, as it will be used in the process instance details in DEV-UI.
- d. Back in the terminal, run the command to run the project.

e. Now in the browser, open DEV-UI: http://localhost:8080/g/dev-ui

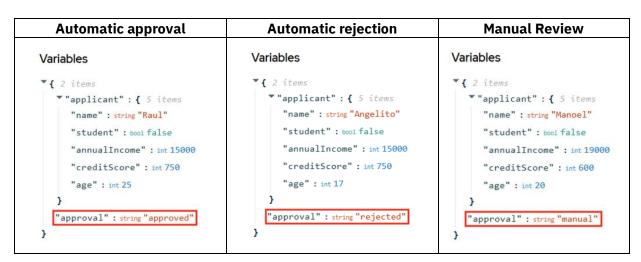

Note: And since we have already navigated this area before, I believe you are already familiar with navigation, if you have any questions, go back and check the steps.

f. Navigate to the "Process Definitions" tile to run the following test scenarios. Use the form and repeat the test with different data that will result in different decision outputs.

AGE	ANNUAL INCOME	CREDIT SCORE	IS STUDENT	SCENARIO
25	15000	750	NO	Automatic approval
17	15000	750	NO	Automatic rejection
20	19000	600	NO	Manual Review

g. Validate by variables if the **result of each scenario** was like this:

If you got the same result, congratulations! Let's move on to the next exercise.

Close the browser. Let's work some more in VS Code and then review again when we're done. Back in the VS Code terminal, stop the execution by pressing the options: [h] then [q].

```
| PROBLEMS OUTPUT DEBUG CONSOLE | TERMINAL | PORTS OPENSHIFT TERMINAL | PORTS OPENSHIPT TERMINAL | POR
```

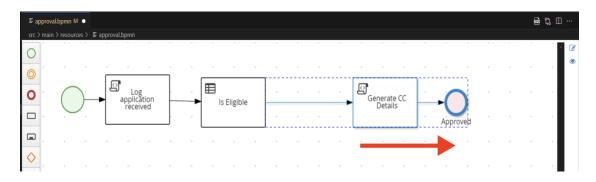

6 Exercise 3: Adding possible process scenarios

Scenario:

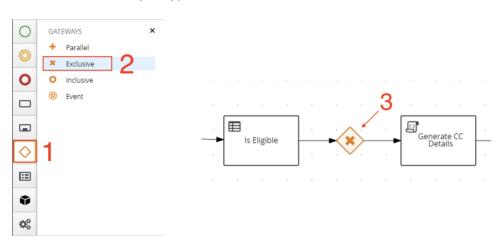

Now let's add the gateway that will divide the process into three possible scenarios: **Automatic Approval, Automatic Rejection,** and **Manual Approval.** Go back to **VS Code** to the "*appoval.bpmn*" file.

Instructions:

a. Select the "Generate CC Details" task and the "Approved" event and drag to the right.

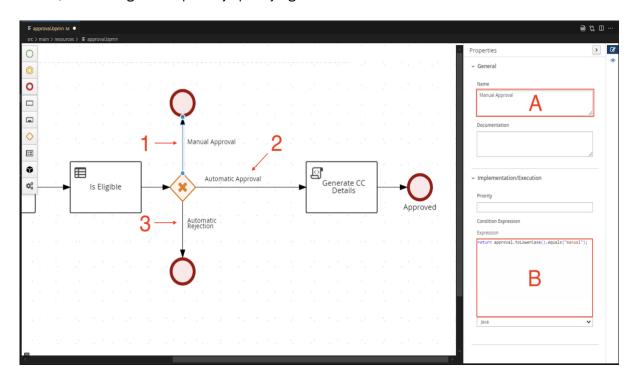

b. In the side panel, select a Gateway of type "Exclusive"

Item	Description
	Drag the Exclusive Gateway to the line separating "Is Eligible" and "Generate CC Details".
3	
	If positioned correctly, the gateway will turn the line blue and new arrows will
	form. If not, simply reconnect the arrows between the two existing nodes.
	From this Gateway, add two new paths to "Final Event", see below:
	, . ,
4	Sometimen approximation and the state of the

c. Now, let's configure the path by specifying the condition to be followed for each scenario.

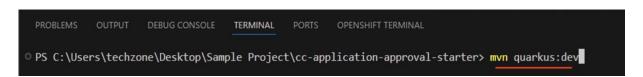

Fill in fields A and B with their respective values:

Item	Description		
	Click to select the path, and fill in the fields on the Properties screen:		
1	FIELD	DATA	
	Name	Manual Approval	
	Expression	return	
		<pre>approval.toLowerCase().equals("manual");</pre>	
	Click to select the	path, and fill in the fields on the Properties screen:	
2	FIELD	DATA	
2	Name	Automatic Approval	
	Expression	return	
		<pre>approval.toLowerCase().equals("approved");</pre>	
	Click to select the	path, and fill in the fields on the Properties screen:	
2	FIELD	DATA	
3	Name	Automatic Rejection	
	Expression	return	
		<pre>approval.toLowerCase().equals("rejected");</pre>	

d. Before running the project, make sure the project has been saved *(CTRL + S)*, and click the SVG button (in the top right corner), to update the process image, as it will be used in the process instance details in DEV-UI.

e. Back in the terminal, run the command to run the project.

mvn quarkus:dev

Now in the browser, open DEV-UI: http://localhost:8080/q/dev-ui

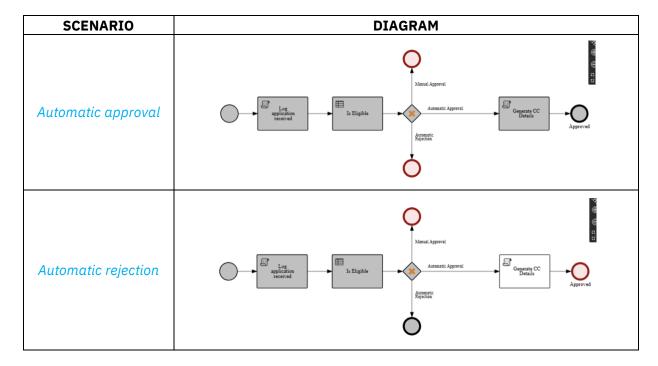

Note: And since we have already navigated this area before, I believe you are already familiar with navigation, if you have any questions, go back and check the steps.

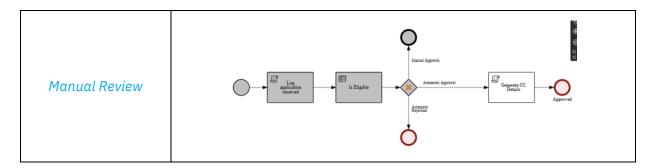

f. Navigate to the "Process Definitions" tile to run the following test scenarios. Use the form and repeat the test with different data that will result in different decision outputs.

AGE	ANNUAL INCOME	CREDIT SCORE	IS STUDENT	SCENARIO
25	15000	750	NO	Automatic approval
17	15000	750	NO	Automatic rejection
20	19000	600	NO	Manual Review

g. Test results:

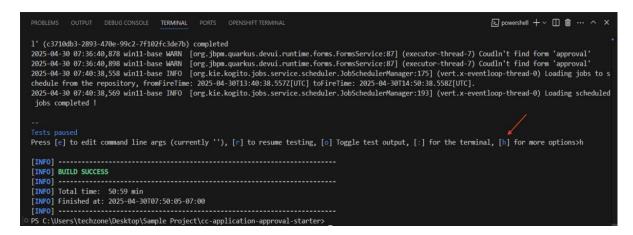

Check the diagram for each scenario, where the path taken after applying the process rules:

If you got the same result, congratulations! Let's move on to the next exercise.

h. **Close the browser**. Let's work some more in VS Code and then review again when we're done. Back in the VS Code terminal, stop the execution by pressing the options: [h] then [q].

7 Exercise 4: Setting up process for Automatic Approval

In this exercise we will configure the process for Automatic Approval of cases in our scenario.

Scenario:

When a credit card application is approved, we need to generate the card details. For this lab, we will start a Service Task that will invoke a Java method, and can easily be used to call a different service. This is the flexibility offered to Java services by jBPM runtime.

In our example, there is a Java class already created to process the credit card details for the approved account. It can be accessed at the location <code>src/main/java/org/acme/service/CreditCardService.java</code>. This class contains the logic to generate the credit card details:

```
src > main > java > org > acme > cc_approval > service > J CreditCardService.java > ...

package org.acme.cc_approval.service;

import org.acme.cc_approval.model.*;

import jakarta.enterprise.context.ApplicationScoped;

@ApplicationScoped

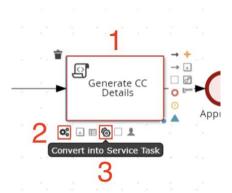

public class CreditCardService {
 public class CreditCardService {
 public CreditCard generateCreditCardDetails(Applicant applicant) {
    // Calculate credit limit based on income (simplified logic)
    double creditLimit = applicant.getAnnualIncome() * 0.3;
    return new CreditCard(applicant.getName(), creditLimit);
}

14
}
```

This service calculates a credit limit based on 30% of the applicant's annual income and creates a new Credit Card object with the details of applicant's name and the calculated credit limit.

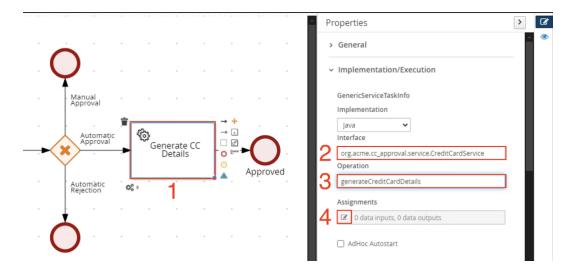

Instructions:

a. To incorporate custom Java code into your process using a Service Task, follow these steps:

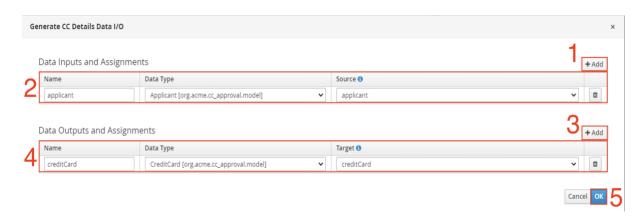

Item	Description
1	Select the "Generate CC Details" task
2	Select the button with the "gears"
3	Select the option to "Convert into Service Task"

b. Continue with task "Generate CC Details" selected.

Item	Description
2	In properties > "Implementation/Execution", fill in the "Interface" field with:
2	org.acme.cc_approval.service.CreditCardService
2	Fill in the "Operation" field with:
3	generateCreditCardDetails
4	Click the button to configure the inputs and outputs, in the next step

c. Add the Inputs and Outputs.

Item	Description	
1	Click "+ Add"	
	Fill in the <i>Data Input</i> fields:	
	FIELD	DATA
2	Name	applicant
	Data Type	Applicant[org.acme.cc_approval.model]
	Source	applicant

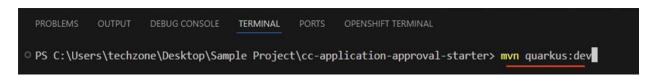

3	Click "+ Add"	
	Fill in the Data O	utput fields:
	FIELD	DATA
4	Name	creditCard
4	Data Type	CreditCard[org.acme.cc_approval.model]
	Source	creditCard
5	Click " OK"	

d. Before running the project, make sure the project has been saved *(CTRL + S)*, and click the SVG button (in the top right corner), to update the process image, as it will be used in the process instance details in DEV-UI.

e. Testing:

Back in the terminal, run the command to run the project.

mvn quarkus:dev

Now in the browser, open DEV-UI: http://localhost:8080/q/dev-ui

Note: And since we have already navigated this area before, I believe you are already familiar with navigation, if you have any questions, go back and check the steps.

Navigate to the "Process Definitions" tile to run the following test scenarios. Use the form and repeat the test with different data that will result in different decision outputs.

AGE	ANNUAL INCOME	CREDIT SCORE	IS STUDENT	SCENARIO
25	15000	750	NO	Automatic approval

Validate by variables if the result of each scenario was like this:

Variables

```
" applicant" : { 5 items
    "name" : string "Angelito"
    "student" : bool false
    "annualIncome" : int 15000
    "creditScore" : int 750
    "age" : int 25
}
"approval" : string "approved"

    "creditCard" : { 5 items
        "cardNumber" : string "0998099538934252"
        "cardHolderName" : string "Angelito"
        "expirationDate" : string "2028-05-05"
        "cvv" : string "356"
        "creditLimit" : int 4500
}
```

If you got the same result, congratulations! Let's move on to the next exercise.

f. **Close the browser**. Let's work some more in VS Code and then review again when we're done. Back in the VS Code terminal, stop the execution by pressing the options: [h] then [q].

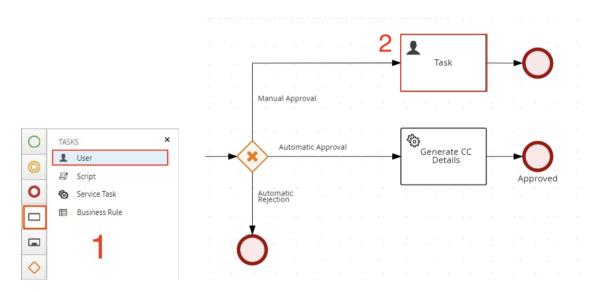

```
| Carried by a complete | Problem | Ports | Openshift Terminal | Op
```

8 Exercise 5: Setting up process for Manual Approval

Scenario: Now we can set up the second possible scenario, when the decision result indicates the need for manual approval, the flow should advance to a user task. Let's add this manual step to the process and see it in action!

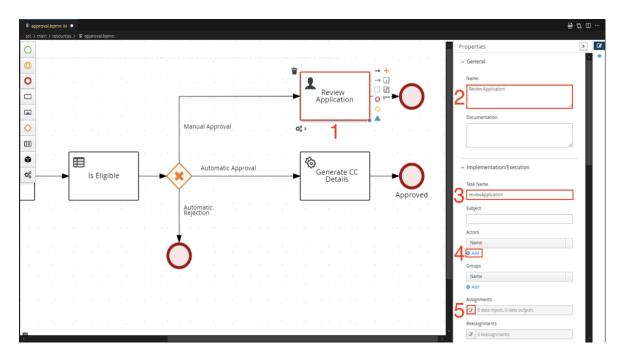

Instructions:

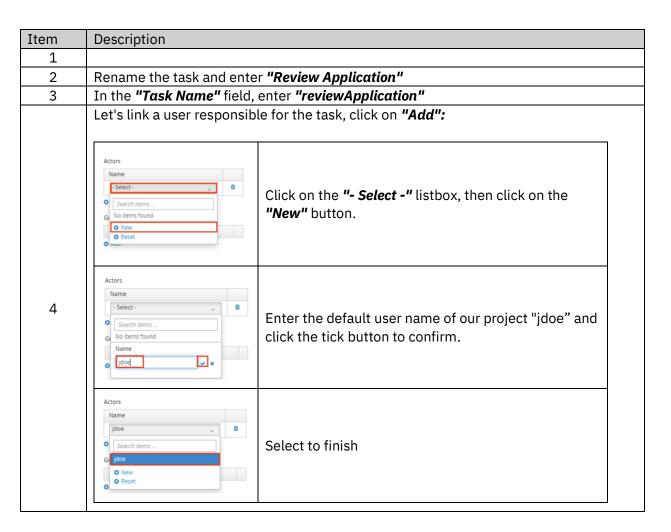

a. We will be adding new elements to the "Manual Approval" flow:

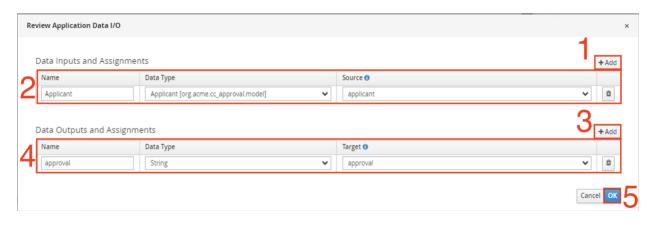

Item	Description
1	Add a task of type "User"
2	Reorganize the "Manual Approval" flow to add the user task after the
2	gateway and end event

b. Select the task user and open the properties panel.

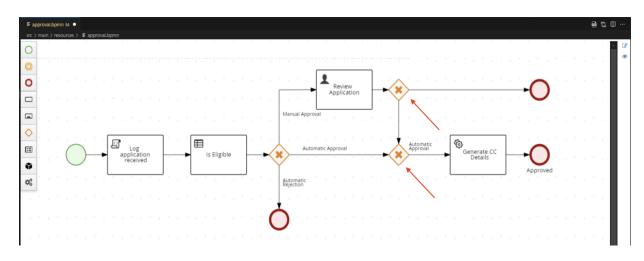

c. Click the button to configure the task inputs and outputs.

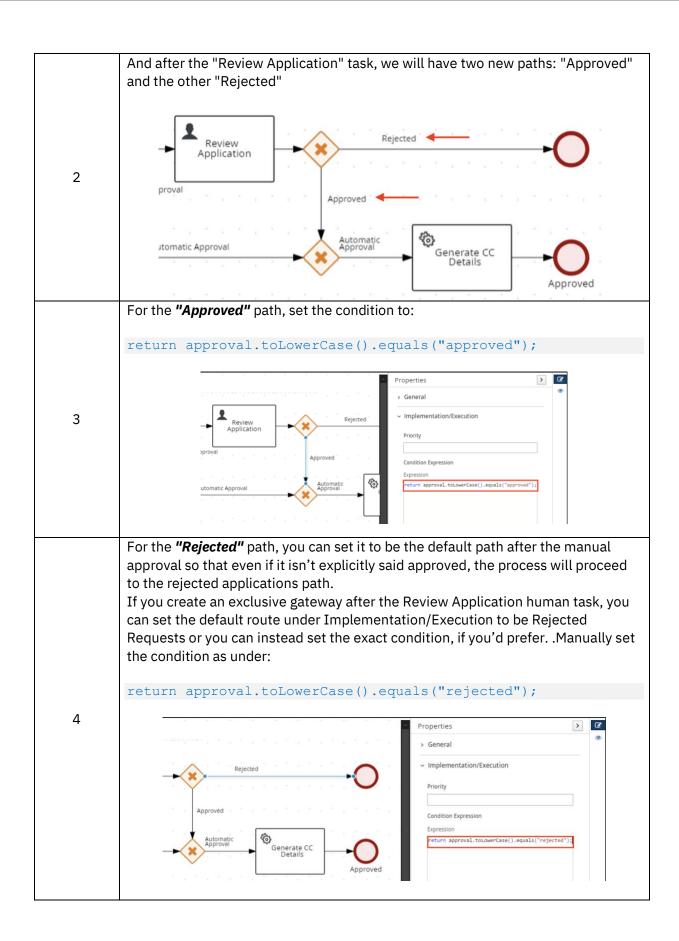

Item	Description
1	Click "+ Add"

	Fill in the <i>Data Input</i> fields:		
	FIELD	DATA	
2	Name	Applicant	
2	Data Type	Applicant[org.acme.cc_approval.model]	
	Source	applicant	
3	Click "+ Add"		
	Fill in the Data O	·	
	FIELD	DATA	
4	Name	approval	
	Data Type	String	
	Source	approval	
5	Click " OK"		

d. The process diagram after the human task of Review Application can be configured in many ways, below is just an example of a possible solution, you do not need to have all of the exclusive gateways coming together, you may simplify if you choose not to. That is ultimately your choice!

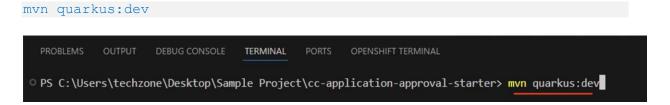

Item	Description
1	Please note that I have reorganized the flow and added 2 new Exclusive Gateways

e. Before running the project, make sure the project has been saved *(CTRL + S)*, and click the SVG button (in the top right corner), to update the process image, as it will be used in the process instance details in DEV-UI.

Testing:

a. Back in the terminal, run the command to run the project.

b. Now in the browser, open DEV-UI: http://localhost:8080/q/dev-ui

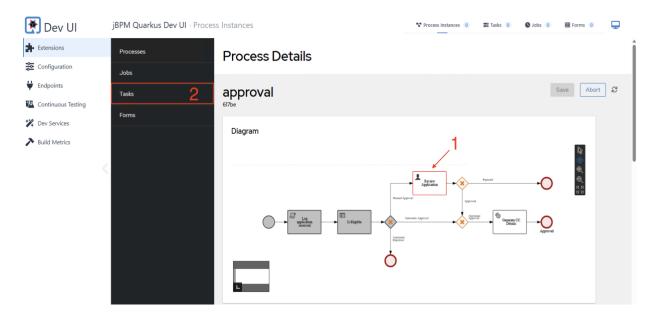

Note: And since we have already navigated this area before, I believe you are already familiar with navigation, if you have any questions, go back and check the steps.

c. Navigate to the "Process Definitions" tile to run the following test scenarios. Use the form and repeat the test with different data that will result in different decision outputs.

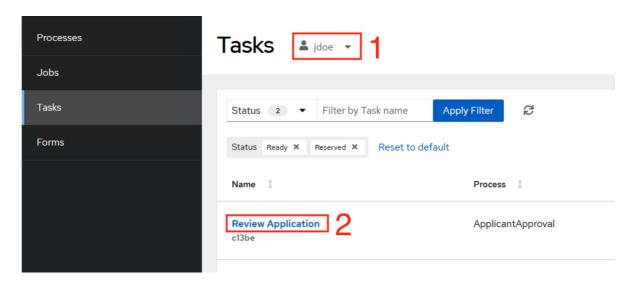

AGE	ANNUAL INCOME	CREDIT SCORE	IS STUDENT	SCENARIO
20	19000	600	NO	Manual Review

d. Note that the instance is already waiting for the action of the user "jdoe", to approve or not this application.

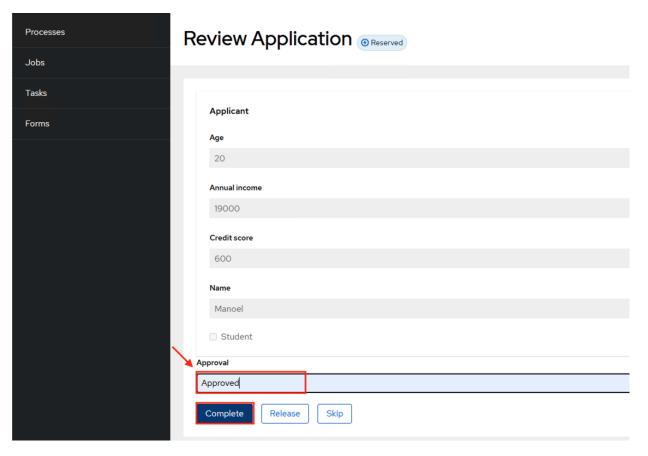

Item	1	Description
	2	Access the "Tasks" screen in the side menu

e. Review Application

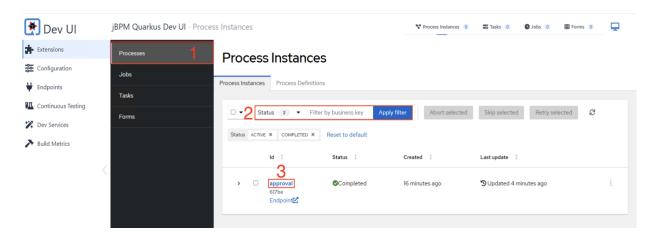

Item	Description
1	Select user "jdoe"
2	Access the instance by clicking on "Review Application"

1	Type "approved" so we can evaluate the result
2	Select the "Complete" button

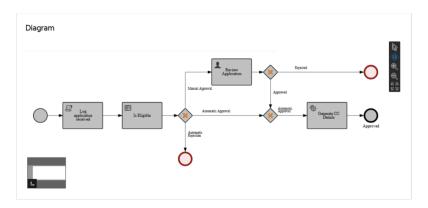

f. Now, let's return to "Process Instances" to evaluate the result.

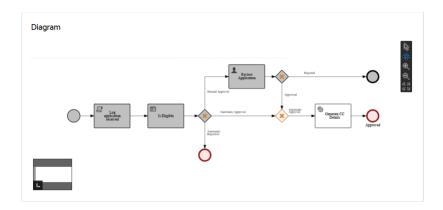

Item	Description
1	Click on "Processes"
2	Don't forget to add the "Completed" status to the filters.
3	Select the instance by clicking on "approval"

Validating the Results:

Validate the result using the diagram and variables, where you can see the path taken and the **approval** result:

Now, repeat the same test, but in the user action, reject the user application, to evaluate the flow. *Note: To reject, just write "rejected"* in the "jdoe" action.

If you got the same result, congratulations! Let's move on to the next exercise.

Close the browser. Let's work some more in VS Code and then review again when we're done. Back in the VS Code terminal, stop the execution by pressing the options: [h] then [q].

9 Exercise 6: Adding a new user

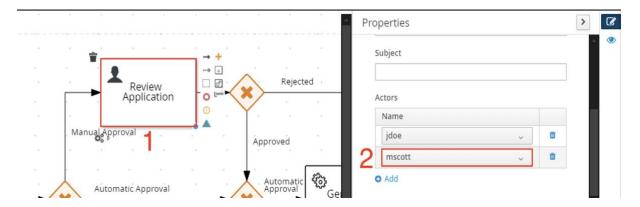

In our scenario, the process is assigned to just "jdoe", ideally, we should use a group, but for this lab we're going to attach a different user. Let's say instead of "jdoe", the tasks will now go to "mscott". We need to make changes for the Dev-UI to work with this.

Note: Before proceeding be sure to close the Chrome instance of the Dev-UI console.

Instructions:

a. Select the user task

	Item	Description
	1	Back in the workflow, select the user task "Review Application"
Ī	2	Repeat the same process to add a new user, including "mscott"

b. If you were to go into Dev-UI now and repeat the steps from the previous section, you would see that a task has been created, but there is no "mscott" actor in Dev-UI to use for finishing the tasks So how do we achieve this? Very easily, a quick change to the properties will allow it to be added to the Dev-UI console.

```
102
103 ############
104 # Misc. dev #
105 ##########

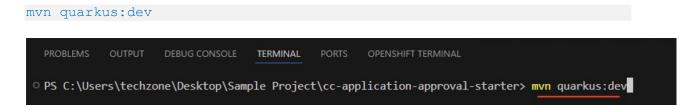

106
107 %dev.quarkus.smallrye-openapi.path=/docs/openapi.json
108 %dev.quarkus.http.test-port=0
109 %dev.quarkus.dev-ui.cors.enabled=false
110 %dev.quarkus.swagger-ui.always-include=true
111 %dev.quarkus.kogito.data-index.graphql.ui.always-include=true
112 %dev.jbpm.devui.users.admin.groups=admin
113 %dev.jbpm.devui.users.jdoe.groups=admin,HR,IT
114 %dev.jbpm.devui.users.mscott.groups=admin,HR,IT
```

Item	Description
1	In VSCode, open "src/main/resources/application.properties"

If you notice on line 113 there is a property that says "jdoe" is the user.

Copy this line, changing "jdoe" to "mscott". Now "mscott" will have the same groups as "jdoe".

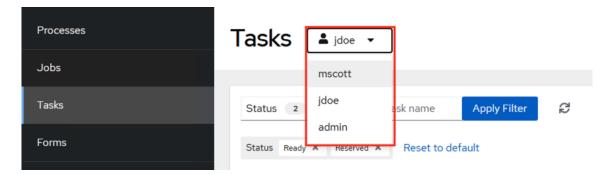

- c. Before running the project, make sure the project has been saved (CTRL + S).
- d. Back in the terminal, run the command to run the project.

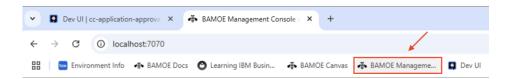

e. Testing: Now in the browser, open DEV-UI: http://localhost:8080/g/dev-ui

Create a manual approval task and verify that it is now assigned to "mscott"

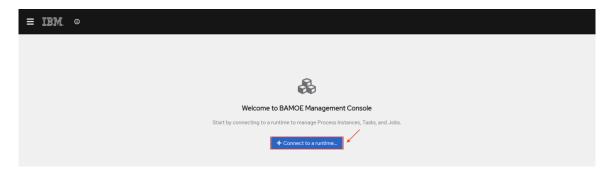

AGE	ANNUAL INCOME	CREDIT SCORE	IS STUDENT	SCENARIO
20	19000	600	NO	Manual Review

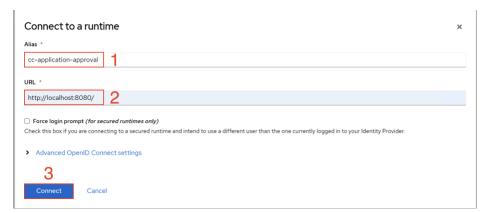

f. You can also connect your application to the BAMOE Management Console. Go to http://localhost:7070/

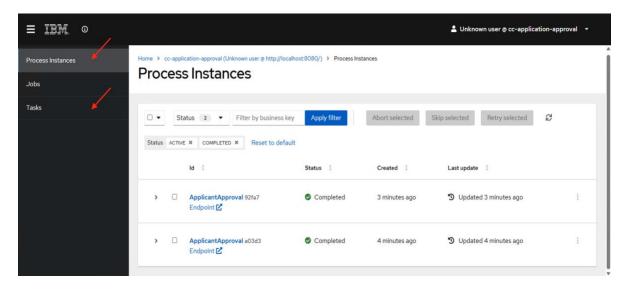

g. Click "Connect to a runtime..."

Item	Description
1	Let's use the same project name "cc-application-approval"
2	Enter <u>http://localhost:8080/</u>
3	Click on "Connect"

Now you can experiment with how the user can perform their tasks, try creating a new instance through Dev-UI or making a call through Swagger, and see the result in the Management Console. Access the <u>IBM documentation</u> for more information.

Congratulations! You have completed this lab, where we explored a practical use case with Workflow and Decision. I hope that from now on you will be able to create and explore your own cases and other BAMOE features.
